Universal Communication without Barriers

Anton BENČIČ, Márius ŠAJGALÍK

Our solution aims to eliminate the cultural and communication barriers and helps the user to understand foreign languages, express their ideas in any language, read unknown writings, navigate in unfamiliar surroundings, quickly find the desired location and it also contributes to solving many other problems of similar nature. Using gesture recognition also extends the applicability of our solution for the deaf, who are otherwise dependent on a live interpreter. Moreover, the whole solution is available as a mobile application, so it is always available whenever we need it.
