InDangerAlarm

Marek LÁNI

As the title implies, the application is for use, when there is an increased level of risk of life-threatening situations. Its basic function, idea and goal is to notify that a specific user is in some kind of danger. Of course similar systems already exist, some alarming equipment that can contact emergency services, or the police eventually, but my application, unlike these other technologies is aimed to effectively use the time before the arrival of paramedics and police. Many times an accident happens close to us, but we do not know about it, thus we can not help, even if we want to. And from the other side, someone needs help and it may be on the next corner, but he is unable to call it. This application proposed by me, tries to solve this problem. Unfortunately, it is unable to save life by itself, and no one will be forced into it, so in the end everything depends on humanity and will to help of people themselves.
